

CAM 2025 SYNTHESIZED FRAMEWORK

OVERVIEW:

CAM 2025 (Choice-Affinity-Modulation) is a predictive and intervention-based model of human behavior. It merges emotional memory, moment context, and applied influence to forecast and shape decision-making in real time.

CORE FORMAL MODEL:

Step 1: Emotional Weighting

$$W = (i_j * ^{(m - m_j)})$$

- i_j : Impression valence [-1, 1]
- m_j : Time of impression
- α : Decay factor
- W : Weighted emotional field

Step 2: Choice Affinity

$$c = \tanh(\alpha * W)$$

- α : Emotional sensitivity

Step 3: Influence & Choice Probability

$$P(c=1) = ((c + S))$$

- σ : Sigmoid function
- β : Decision sensitivity
- γ : Influence amplifier
- S : Svengali force (your timed intervention)

CAM maps behavior not as fixed or random but as a trajectory shaped by experience, impression, moment, and intervention.

SIMULATION EXAMPLE:

- Impressions: mix of positive/negative over time
- $W = -0.8819$ $c = -0.785$
- $S = -0.5572$ (bad move)
- $P(c=1) = 0.0046$ (choice highly unlikely)

CAM APPLICATION PATHWAY:

1. DATA COLLECTION:

- Track E (experiences), I (emotional impressions), M (context), S (interventions)

2. ANALYSIS:

- Compute W , c , then simulate outcomes using varying S

3. INTERVENTION:

- Choose optimal S at optimal time to shift c

4. USE CASES:

- Dating, influence, therapy, leadership, negotiation, self-change

NOVELTY:

- Combines behavioral science + system dynamics
- Transforms behavior into a calculable, influenceable system

- Bridges time-weighted memory and real-time persuasion

FOR NOBEL-WORTHINESS:

- Must show utility at scale
- Must be experimentally validated
- Must outperform legacy models in predictive accuracy and ethical influence

CAM is not just a model. It's a language of human movement.
